How to include styles

- **External CSS** (Best Practice)

```
<head>
    <title>Titulek</title>
    <link rel="stylesheet" type="text/css" href="style.css">
</head>
```

- **Internal CSS** (Single Page)

```
<head>
    <style type="text/css">
        body { color: white; }
        h1 { color: red; }
    </style>
</head>
```

- **Inline CSS** (Bad practice)

```
<h1 style="color: red">Header</h1>
```

Semantic HTML conveys meaning.

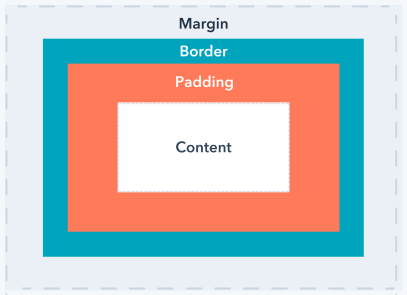
Task 1: Inheritance and Page Layout

1. **Demonstrate Inheritance:** Set a global text color for the document body. Observe how it applies to all child elements (like paragraphs).
2. **Override Inheritance:** Change the color of `<h1>` elements to a different color to see how specific selectors override parent styles.

```
body { color: #333333; }
h1 { color: navy; }
```

3. **Container Setup:** Limit the site width and center the content in the browser window.



Task 1: Inheritance and positioning

4. Limit the site width and center the content.

```
display: block;
max-width: 30vw;
margin: 0 auto;
```

5. Place the second and third sections next to each other.

```
display: flex;
flex-direction: row;
```

6. Position the fourth and fifth sections next to each other.
   - *Hint: Apply the same Flexbox logic as in the previous step.*
7. Use a grid layout.
   - Arrange the elements of the fourth section into a grid layout.

```
display: grid;
grid-template-columns: auto auto;
```

Task 2: Margins and paddings

8. Insert appropriate spacing between every section.
   - Use relative units (e.g., `rem` or `em`).
9. Center the table element.
   - Use the margin or grid approach.

What will be evaluated?

1. The whole site is **center-aligned**.
2. The **second** and **third** sections are **next to each other**
3. The **fourth** and **fifth** sections are **next to each other**
4. Ensure proper **spacing between sections**
5. **Validate** your solution (zero warnings/errors) using:
   - HTML validator
   - CSS validator
